- The provision of wire and radio communications for the Minis y of the Merchant Fleet (MMF), is the responsibility of the Central Directorate for Communications and Electro-Radio-Navigation Equipment (Tsentral'nyy Upravleniye Svyazi i Elektro-Radio-Navigatsii), MMF. This directorate does not supply the only channel of communications for the MMF, however, as the facilities of the Ministry of Communications (Minsvyaz') are also used by the MMF. The facilities of Minsvyaz' are used to a considerably lesser extent than those of the Central Directorate.
- 2. The basic responsibilities of the Central Directorate for Communications include the following:
  - (a) Maintaining all telephone and radio communications within the MMF. Formerly the non-tuneable receivers and speakers which are placed throughout the Merchant Fleet for the amusement and enlightenment of the listeners were under the control of this Directorate. These devices have now been placed under the jurisdiction of the Ministry of Communications (Minsvyaz').
  - (b) Assigning shipboard and shore communications equipment to Merchant Fleet activities.
  - (c) Organizing training programs for Merchart rleet communications specialists and assigning these specialists to MAF activities upon completion of their training.
  - (d) Preparing and issuing equipment handbooks and training pemphlets for communications personnel. This item includes instructions relative to the operational phases of code and cipher work.

25X1

- (e) Maintaining all electro-radio-navigation equipment. This includes radio, gyrocompasses and direction finding equipment.
- (f) Developing improved methods of equipment operation and exploitation.

		SECRET,
Phere	are	certain basic principles and rules controlling the transmiss'on of infor-
matio	n wi	thin the MMr. Special precedence intre communications channels. The fol-
Lowin	g pr	ry mail and that sent by radio and with which traffic is handled:
		mary mail
		If there is no urgency attached to a letter it is sent in a routine manner without any precedence indicator.
		If there is urgency connected with delivery of a letter it is marked "urgent" (Srochno).
	(3)	If the delivery of a letter is very important it is marked "very urgent" (ves'ma srochnaya, v-srochnaya).
(b)		cgrams
		There is no precedence indicator marked on messages which have no urgency attached to their delivery.
		If there is urgency associated with the delivery of the message it is marked "lightning" (molniya).
		The message is marked "deliver immediately" (vruchit' nemedlenno) if it is still more urgently in need of delivery.
	(4)	Messages demanding the greatest speed of delivery are marked "deliver immediately to the person of the addressee" (vruchit' nemedlenno po mestu nakhozhdeniya). This means that the message is to be delivered to the addressee in person, even though he is not in his office. It would be necessary for the communications office to determine the whereabouts of the addressee and hand him the message.
• •		grams
	/	telegrams sent by the Ministry of Communications are marked "governmental" vitel'stvermaya). This precedence indicator is limited to wires sent by the graph services of the Ministry of Communications.
		phone grams
	ary	same precedence indicators are used for telephone grams as are marked on ordin- mail.
total vire	num comm	sent out by voice over telephone lines constitute the largest percentage of the ber of messages transmitted both in the MMF and the entire Soviet Union. The unication equipment used by the MMF for this type of transmission is of US contraction equipment used by the MMF for this type of transmission is of US contractions.
There loads trans	is itead	also a very high frequency radio telephone system in use between Fourteen Foots and Astrakhan which is also of US construction. This entire set (receiver, er and handpiece) would weigh about 40 kilograms. The set has a range of about 0 kilometers.
to exof race chasi	ms and dio dio dio dio dio dio dio dio dio di	ginning of 1949 the government took steps to limit the usage of radio communi- nd further cuts are constantly being made. Great efforts are being undertaken the usage of telephone grams and ordinary mail in order to curtail the volume communications. In furtherance of this, a limitation of 200 words has been the length of radiograms. The official reason given for the decline in em- radio communication was the desire toralizes the work load of the already ned radio stations. The reason accepted at Reydtanker headquarters, however, by the simplicity of reading a message crally over the telephone as opposed to ling a massage in marke code by radio.
nead L per	of s	people who have been assigned one of the special occumulations titles, such as teamship agency planning department - CHPM are allowed to send radiograms. If does not possess such a title he must then get the approval of one of the titled in order to have the message transmitted.
		rel rule the person sending the massage is responsible for assigning the proper

SECRET			] · .	
)ECRET				

25x1

If a message is supposed to be sent in cipher and the sender gives it to the secretariat of the agency for transmission in plain text, a violation of security has occurred. The chief of the secret department (sekretniy otdel) may either report the incident or return the message to the originator for proper handling. If the matter is reported officially the offender probably will be brought to trial. This is a matter which is within the discretion of the head of the secret department, and if he is friendly with the heads of the other sections the incident will probably not be reported.

-- 3 -

- 9. In June 1947, a decree of the Presidium of the Council of Ministers was handed down relative to the transmission of operational information pertaining to ministerial activities. Prior to this decree all such information had been sent openly in plain text traffic. By this decree certain types of information became classified and thenceforth had to be encoded.
  - (a) Figures revealing the volume and scope of ministerial operations.
  - (b) Disposition and deployment of Soviet fleets.
  - (c) Data on the numbers and types of workers
  - (d) Data relative to the technical condition of equipment.
  - (e) Information relative to accidents or catastrophes which might be used as anti-Soviet propaganda. (Revoltanker usually had a couple of hundred accidents annually, two or three of which would result in fatalities.)
  - (f) Breakdowns or failures of equipment.
- 10. It became common practice for nearly all officials of the MAF to try to avoid having messages encoded. The reason was that there were numerous regulations to be followed and the people were reluctant to become involved in the established procedures. Most officials used covert means to send classified material by plain text channels in spite of the above decree.

For example if an official in Moscow requested a report from Reydtanker with regard to personnel status of the steamship agency it was classified information per se. The Moscow official probably had received, however, many such reports in the past from the agency and he simply would request the efficial to supply the information which was usually forthcoming at the particular time involved. Usually there were standard forms which were followed by the reporting agency for different types of information, such as wages and payrolls, numbers of workers and technicians, and hours worked. The head of the labor and wages department would simply take the blank form used in the desired report and fill in the necessary data to complete the form. He would then take the figures from the report form and either letter or number them in sequence and send these figures out in plain text without further identification of the text. The figures by themselves would mean nothing to anyone reading the message and certainly not to the head of the secret department. When the Moscow official received the message he would enter the data shown in the message on a duplicate of the originator's personnel form and thereby have all of the information which he had requested. This was very common practice in transmitting operational information by radic and wire communications.

11. A sample radio message blank has been reportured below. The letters in parentheses have been supplied for ease in the description of the form.

## HadioGram (Radiogramma)

(a)	Transmitted	(c) Precedence
(b)	Received	•••
(ā)	From (city)(e)Ser No	(f)Groups(g)DateTime
(a)	Addressee City or place Title Name of person	
(1)	Text of message	(j) Originator's serial number (k) Originator's title (l) Originator's Name
(a)	This is the date and time that	the radio operator commenced sending the message.

(b) This is the date and time that the receiving operator acknowledged receipt of the message.

- (c) The precedence assigned to the message by the originator is marked in this space.
- (d) This is the place from which the message is sent.
- (e) This is the serial number assigned to the message by the originating radio station. This number is assigned consecutively to all messages transmitted from the station and the first message sent out in the calendar year is #1. The message numbers are terminated at the end of each year and a new series commenced on January 1st.
- (f) This shows the number of words in the text of the message.
- (g) The message date and time assigned by the transmitting station is placed in this blank.
- (h) The place, title and name of the addressee is written in this space.
- (i) This space is for the text of the message.
- (j) At the end of the text the serial number assigned to the message by the originating agency is written. The secretariat for the originating agency assigns numbers to all outgoing messages and records these numbers with the names of the originating officials. It is this serial number that is referred to in replies by the addressees.
- (k) This is the title of the originating official. The titles in both (k) and (h) are generally the short form titles which have been assigned to the officials of the MAF.
- (1) This is the name of the originating official.

These message blanks were written out by hand in Reydtanker as there were only fifteen typewriters for the entire steamship agency. My writing was fairly good, but some of the officials took delight in writing poorly just to bedevil the poor radio operators.

- 12. Reydtanker operates a radio station which services all MAF activities in Astrakhan. Among the activities so served are:
  - (a) Astrakhan Maritime Dry Cargo Port (Astrakhanskiy Morskiy Sukhogruzniy Port). (This was formerly the Astrakhan Dry Cargo Maritime Agency - Astrakhanskoe Sukhogruznoe Morskoe Agentsvo-Kaspflot)
  - (b) Roadsteads Technical Fleet (ReydTekhFlot)
  - (c) Maritime Registry (Morskoy Registr)
  - (d) Ship Repair Yard i/n Karl Marks
  - (e) Ship Yard (Sudo Verf'), Merchant Fleet
  - (f) Basin Committee of the Seaman's Trade Union (BEROF)
  - (g) Basin Judge Advocate (BPROK)
  - (h) 8th Detachment of the Militarised Guard (Vos'moy Otryad Vokkr).
  - (i) Caspian Inspectorate of Port Facilities (Kaspiyskaya Inspektaiya Portovogo Nadsora)

The Soviet Navy might use the local communication facilities of the LMF when conducting actual operations with Reydtanker, but not otherwise. Such operations in the yest cocurred when Reydtanker was engaged in piloting Navy vessels through the Volga Delta. Under no conditions would the MMF stations handle Navy traffic with a distant city such as Moscow or Odessa.

13. Reydtanker operates four radio stations which are located at the following places:

Astrakhan - on the Island of Zayachiy in the settlement of workers for the chip repair yard 1/n 10th Anniversary of the October Revolution. There are four send-receive positions at this station; one for Astrakhan-Moscow, one for Astrakhan-ships, one for Astrakhan-Balm and one for Astrakhan-Gurev, Selo Ciya, 14 Foot Roadsteads.

Solo Olya - This village is on the Volga Delta and has one send-receive station.

14 Foot Roadsteads - This station consists of two send-receive positions aboard the floating dook (debarkadar) DCNRASS.

Gurey - There is one send-receive position located on the Island of Pesimoy and there was to be a second send-receive position added to this station.

25X1 25X1

14. Specific schedules were followed by the Astrekhen radio station of Raydtanber. This station handled a large amount of MAF traffic to and from Astrekhen. All transportation activities throughout the Soviet Union operate on Mossow time. Thus all broadcasts listed
